B-29 Superfortress Jun 20 2020 The Boeing B-29 Superfortress was a four-engined heavy bomber flown primarily by the United States in World War Two and the Korean War. The B-29 remained in service in various roles throughout the 1950s. The British Royal Air Force flew the B-29 and used the name Washington for the type, and the Soviet Union produced an unlicensed copy as the Tupolev Tu-4. The name "Superfortress" was derived from that of its well-known predecessor, the B-17 Flying Fortress. The B-29 was the progenitor of a series of Boeing-built bombers, reconnaissance aircraft, trainers and tankers including the variant, B-50 Superfortress. The B-29 was one of the largest aircraft to see service during World War Two. A very advanced bomber for its time, it included features such as pressurized cabins, an electronic fire-control system and remote-controlled machine-gun turrets. Though it was designed as a high-altitude daytime bomber, in practice it actually flew more low-altitude nighttime incendiary bombing missions. It was the primary aircraft in the American firebombing campaign against Japan in the final months of World War Two, and carried the atomic bombs that destroyed Hiroshima and Nagasaki. Unlike many other World War Two-era bombers, the B-29 remained in service long after the war ended, with a few even being employed as flying television transmitters. The type was finally retired in the early 1960s, with 3,960 aircraft in all built. Without doubt there is a clear, strong requirement to put the record straight using primary source documentation to record the undoubted achievements alongside and in context with the shortcomings to the types design and operation that have otherwise received scant attention. The book will cover all variants and is profusely illustrated.

Canon 50D. Oct 17 2022 This is the eBook version of the printed book. If the print book includes a CD-ROM, this content is not included within the eBook version. Canon's new EOS 50D bridges the gap between the novice and the seasoned pro with a perfect combination of high-speed and quality. For anyone who has upgraded from their point-and-shoot or first DSLR to a Canon 50D and wants to get the best shots possible but isn't sure what to do next. There's the manual of course, as well as competing books, and while they all tell 50D owners, often in 400+ pages, what the camera can do, none of them shows them exactly how.

Theory and Modeling of Cylindrical Nanostructures for High-Resolution Coverage Spectroscopy Apr 30 2021 Theory and Modeling of Cylindrical Nanostructures for High-Resolution Coverage Spectroscopy presents a new method for the evaluation of the coverage distribution of randomly deposited nanoparticles, such as single-walled carbon nanotubes and Ag nanowires over the substrate (oxides, SiO₂, Si₃N₄, glass etc.), through height measurements performed by scanning probe microscopy techniques, like Atomic Force Microscopy (AFM). The deposition of nanoparticles and how they aggregate in multiple layers over the substrate is one of the most important aspects of solution processed materials determining device performances. The coverage spectroscopy method presented in the book is strongly application oriented and has several implementations supporting advanced surface analysis through many scanning probe microscopy techniques. Therefore this book will be of great value to both materials scientists and physicists who conduct research in this area. Demonstrates how to measure quantitatively the composition of coverage of nanoparticles, exploiting the distribution of the nanoparticles into several aggregates Explains the method for evaluation of the coverage distribution of a substrate by randomly deposited nanoparticles utilizing experimental data provided by scanning probe microscopy techniques Explains how the methods outlined can be used for a range of spectroscopy applications Provides great value to both materials scientists and physicists who conduct research in the modeling of

cylindrical nanostructures

Fatigue '96 Sep 16 2022 The aim of the 6th International Fatigue Congress, besides covering the entire field of fatigue, was to promote the intimate connection between basic science and engineering application by the selection of appropriate session topics. Fatigue is the main cause of failure of engineering structures and components. Making reliable fatigue predictions is highly difficult because knowledge about fatigue mechanisms in all stages of the fatigue process must be developed much further. In addition, the decreasing availability of raw materials and energy resources forces engineers to continually reduce the weight of constructions. This congress presents research results also particularly for new materials, including composites. Researchers, on the other hand, are confronted with the engineering demands. Furthermore, the overwhelming development which is presently taking place in the field of computer software and hardware dealing with fatigue problems is outlined along with the directions of future developments in all areas of fatigue. Close to 300 fully peer-reviewed papers are published in the proceedings, including nearly 30 overview and keynote papers covering the various session topics. The proceedings should therefore serve as a comprehensive review of the fatigue field at the present state-of-the-art, suitable for scientists, engineers and students.
