The theme of Saturn's Moon Titan Owners' Workshop Manual is how Titan works "as a planet," with an emphasis on illustrating the features and processes of Titan — where the conditions and materials can be exotic — with familiar analogs from the Earth or other planets. The book includes numerous images from the field, the air, and satellites to show comparable features on Earth or other planets. The final chapter discusses Titan in practical terms as an environment for humans in the future, bringing the place "to life." All models. The Huygens probe's seven-year voyage through space (past Venus, Earth and Jupiter) attached to the Cassini orbiter, its arrival at Saturn and three-week dormant coast to Saturn's moon, Titan, culminated in Huygens' hypersonic entry into Titan's atmosphere, 2.5-hour parachute descent, and continued operation for 72 minutes on the surface transmitting data back to Earth via the Cassini orbiter. Saturn has 62 confirmed orbiting moons, but Titan (which is larger than the planet Mercury) was chosen as a has two major components of Earth's atmosphere - nitrogen and oxygen - but the oxygen is was thought to be frozen as water ice within the body of the moon. If Titan received more sunlight, its atmosphere might well resemble that of a primitive Earth. The hope is that study of the data gathered about Titan will help us to understand how the Earth evolved, and possibly what led to the evolution of life. Rod set out to create a new kind of owner's workshop manual—friendly, easy to understand, yet more detailed than any other manual: this book is the result, Rod stripped down an MX-5 ('Miata' USA/'Eunos' Japan) in a domestic garage using ordinary tools and, in the process, took over 1500 step-by-step photographs. The result is a superbly detailed text which passes on to the reader every detail of important jobs, including how problems can be overcome without resorting to special tools. This rapidly paced book provides a fascinating insight into how our understanding of Mars has developed. When a Renaissance astronomer studied the motions of Mars in the sky, he discovered the laws of planetary motion. With the advent of the telescope, the planet could be studied as a world in its own right, measuring the length of its day and mapping its surface in ever more detail. Late in the 19th century, Percival Lowell in the USA claimed Mars was criss-crossed by canals created by a race of intelligent beings to transport water from the polar ice caps to the equatorial areas. Although Lowell's vision of Mars was rejected by astronomers, it inspired storytellers to write classic works of science fiction. By the mid-20th century, the consensus view was that large tracts of the planet hosted a hardy form of vegetation. Given the limitation of telescopes, the only way to be sure was to send a probe. The engaging text, supported by numerous technical illustrations, photographs and graphics, relates the challenges and technical triumph of sending space vehicles to Mars, initially on flyby missions, then to orbit the planet, and more recently to land on it. Mars is a world of contrasts. Much of the southern hemisphere is cratered highlands and much of the northern hemisphere is a low-lying plain that might once have held an ocean. There are volcanoes and canyons much larger than those on Earth, and broad channels cut by vast floods - all formed early in the planet's history. Mars has suffered extreme climate change. Did life develop there when the planet was warm and wet? Did it adapt to the current arid and cold conditions? We looked for microbes in the soil with indeterminate results. Soon, we hope to drill to seek evidence of microbes living beneath the surface. The implications of finding life on Mars are profound, because if life can develop independently in several places in the solar system then it is probably ubiquitous across the universe. The Mars Owners' Workshop Manual chronicles this story of discovery and looks forward to the time when we will join our robots in exploring the intriguing Red Planet.
